

PUBLIC KEY VALIDATION SERVICE

Abstract of the Disclosure

A public key validation agent (PKVA) includes a registration authority
5 which issues a first unsigned public key validation certificate (unsigned PKVC)
off-line to a subject that binds a public key of the subject to a first public key
serial number (PKVN). The registration authority maintains a certificate
database of unsigned PKVCs in which it stores the first unsigned PKVC. A
credentials server issues a disposable public key validation certificate
10 (disposable PKVC) on-line to the subject. The disposable PKVC binds the
public key of the subject from the first unsigned PKVC to the first PKVN from
the first unsigned PKVC. The credentials server maintains a table that contains
entries corresponding to valid unsigned PKVCs stored in the certificate database.
The PKVA can be employed in a public key validation service to validate the
15 public key of the subject before a private/public key pair of the subject is used
for authentication purposes.
